VINCENT HOANG

Applied AI / FDE / Software Engineer

Los Angeles, CA | vincentyhoang@gmail.com | (323) 369-9033 | github.com/Ricecrackerz | linkedin.com/in/vincentyhoang | ricecrackerz.github.io

SUMMARY

Software engineer with 4 years at Dell building REST APIs, data pipelines and test automation for enterprise infrastructure, now focused on applied AI: tool-using LLM assistants grounded in real data and measured with evals. Owns features from design to production and turns messy requirements into working software. Builds AI features that are tested and measurable, not demo-only. Works across teams, from JPL scientists to cross-functional squads.

EXPERIENCE

Dell Technologies, Infrastructure Solutions Group — Sep 2022 – Jul 2026

Software Engineer II (2025 – 2026), Software Engineer I (2022 – 2025) — *Irvine and Santa Clara, CA*

Rotation program across AI/Computer Vision & Data Analytics, CloudIQ and PowerProtect Data Manager.

- Delivered a REST API SDK with documented usage and updated the public REST API docs for PowerProtect Data Manager's storage and cloud-replication APIs, giving teams a supported client over direct Java calls.
- Engineered export-asset REST APIs and re-architected the data-filter logic in a backup replication-manager CLI.
- Owned 11 VM discovery and recovery test suites: migrated 5 daily pipelines to a new lab with Ansible, refactored a 42-test suite so tests run in any order, and cut archive-restore pipeline failures from 16 of 26 tests to 2 or fewer.
- Onboarded Nutanix AHV smoke tests onto Dell's One CI/CD pipeline (cluster, Jenkins jobs, runbook) and automated the MFA file-level-restore test that gated a Sev2 defect's closure.
- Implemented backend APIs and data pipelines for PowerEdge device health scoring in CloudIQ, covered by PACT contract, unit and end-to-end integration tests; resolved 7 third-party CVE findings flagged by Black Duck.
- Applied Copilot and Roo Code across 8 AI Acceleration sprints to generate test helpers and provisioning scripts.
- Won Dell ISG's 2022 local hackathon with a Flask/React microservices tool for switch-config collection.

NASA Jet Propulsion Laboratory — Jun – Aug 2021, Jan – Jun 2022

Software Engineer Intern — *Pasadena, CA*

- Developed a 3D globe web app (D3, Node.js, Python) for 30 years of ocean data; sped stakeholder analysis by 50%.
- Created a geospatial web app (Node.js, PostgreSQL) for analyzing 10,000+ pollution data points.
- Worked directly with JPL scientists and stakeholders to turn their analysis needs into features in both apps.

PROJECT

Paddle Pal, an AI assistant for choosing a pickleball paddle — Oct 2026 – Present

Python, FastAPI, SQLite, Claude API — Live demo · GitHub

- Designed a tool-using LLM assistant that answers only from a measured spec table (500+ paddles) and hand-written knowledge pages, with six tools and the data rules enforced in code.
- Wrote 86 eval questions (tool choice, cited facts, scope and retrieval) before the code they score; 37 of 39 correct tool choices on the first full live run, and every real miss since becomes an eval row.
- Shipped a streaming chat app (accounts, saved chats, daily caps, admin data upload) to a private beta of real players, and cut open-question failures from 5 of the first 10 to 0 within a day using a question log.

LEADERSHIP

- Scrum Master for a cross-functional engineering team across 13+ sprints.
- Led the Networking Committee of Dell's engineering rotation program across 7 U.S. sites (~80 engineers per cohort).

SKILLS

Applied AI: LLM tool use and agents, RAG, embeddings, hybrid search, evals, prompt engineering, Claude API
Programming: Python, SQL, JavaScript/TypeScript, Java
Backend and DevOps: REST APIs, FastAPI, Flask, Node.js, PostgreSQL, Docker, Jenkins, CI/CD, Ansible, PACT

EDUCATION

B.S. Computer Science, Cal Poly Pomona · GPA 3.67, 6x Dean's List — May 2022
